

Tamareddtchy

your Reddit soul, raised as a 3D pet

Operator Manual

How to run, play, and ship the virtual pet whose body is a living 3D readout of your Reddit personality.

CONTENTS

What is in this manual

01	The problem	why Reddit games die on day three	3
02	What it does	the pet, the genome, the loop	4
03	The genome	12 genes, 6 opposite pairs	5
04	Anatomy	how a body is grown from genes	6
05	The breeding economy	generations, deals, lineage score	7
06	Walkthrough: hatch	the onboarding diet picker	8
07	Walkthrough: nursery	feeding and growth	9
08	Walkthrough: genome card	your build, shareable	10
09	Walkthrough: mate market	finding your opposite	11
10	Architecture	client, server, shared rules	12
11	Run and ship	local, tests, publish to Reddit	13

Reddit games die on day three

They spike on launch day and vanish by the weekend. Two things are missing every time: a reason to come back, and a reason to care about anyone else playing. Tamareddtchy is designed backwards from the return visit.

Today	With Tamareddtchy
You lurk your usual subs and never leave them	Your best move is to find your opposite and team up
A game post is played once and scrolled past	Your creature posts itself when it grows, hatches, or breeds
Engagement is an abstract number	Engagement is the food that shapes a creature you are attached to
Winning is a high score nobody remembers	Winning is a visible, multi generation lineage you built with others

It is a game about leaving your bubble, dressed up as a pet you cannot stop checking on.

A pet whose body is your Reddit personality

You hatch a small creature. From that moment its body is a pure function of what you do on Reddit. The creature is never stored as a picture. It is rebuilt in 3D, every frame, from twelve numbers.

12

genes drive the body

6

opposite pairs

3D model files

The loop

Hatch by picking the corners of Reddit you live in. **Feed** by reading, commenting, and posting, which pushes points into genes and reshapes the body. **Grow** from egg to adult across days of nurture, with hunger that decays in real time. **Breed** with a complementary partner to climb the generations.

The four scoring hooks

Hook: a creature that droops when ignored and a streak you do not want to break. **Retention:** real time hunger, multi day generation climbs, mate requests that resolve on a return visit. **User contributions:** every milestone renders an image and posts itself. **Reddit-y:** the mechanic is upvoting, commenting, and cross community rivalry.

12 genes, 6 opposite pairs

The genome is the whole game. Everything visual and every score derives from these twelve numbers. They are arranged as six complementary opposite pairs, which is what makes "crossing distant gene pools" a real mechanic.

Pair	Gene A	Gene B	Example subreddits
Mind vs Body	Knowledge	Vitality	r/science . r/fitness
Logic vs Feeling	Tech	Heart	r/programming . r/aww
Order vs Chaos	Craft	Mayhem	r/DIY . r/funny
Now vs Forever	Pulse	Lore	r/news . r/history
Self vs World	Inner	Social	r/meditation . r/AskReddit
Real vs Dream	Earth	Fiction	r/space . r/movies

What good genetics means

Not a high score on one gene. Good genetics means **both sides of many pairs are developed**. A creature strong in both Knowledge and Vitality is fitter than one that only grinds Knowledge. You can only reach that by breeding with someone unlike you, which is the entire point.

How a body is grown from genes

Each of six body slots is owned by exactly one pair. The pair's balance picks the shape; the pair's magnitude picks the size. Generation pushes the whole rig further from the baseline blob, so lineage depth is visible at a glance.

Body slot	Driven by	What it shows
Head	Knowledge / Vitality	domed brain-head vs sleek athletic head
Eyes	Tech / Heart	small visor eyes vs big warm doe eyes
Torso	Craft / Mayhem	tidy geometric shell vs lumpy chaotic blob
Arms	Pulse / Lore	antenna arms vs scroll arms
Legs	Inner / Social	single rooted base vs many running legs
Aura	Earth / Fiction	orbiting leaves vs a wizard hat

Two whole-genome derivations finish the look: the **palette** comes from the two highest genes, and the **growth stage** (egg, blob, child, adult) comes from total nurture. All of it is computed live in Three.js. Nothing is downloaded.

Opposites win, twins make a mess

Mating is a deal between two players, not a symmetric merge. Exactly one offspring is produced and exactly one player owns it. Who keeps it, and what is traded for it, is negotiated. That negotiation is the strategy.

Pairing	Produces	The strategy
Gen-1 x Gen-1	a plain Gen-2	cheap starter, breed wide for offspring count
Gen-3 x Gen-3	a strong Gen-4	both want the kid, a hard-fought deal
Gen-5 x Gen-1	an advanced Gen-6	the Gen-5 holder has the leverage and can demand a price

Cost to mate: a big hunger hit plus a multi day cooldown, so climbing the generation ladder costs real nurture time. **Generation** of a child is $\max(\text{parents}) + 1$, which is why pairing with a higher generation partner pulls your lineage forward.

The win metric: lineage score

Lineage score blends three axes so no single track dominates: **depth** (deeper generations are worth exponentially more), **quality** (complementary, developed genomes score high, inbred ones do not), and **breadth** (every viable offspring adds a bonus).

Hatch: tell it who you are

On first run, the player picks the corners of Reddit they actually frequent. This seeds the genome so the creature looks like them from minute one instead of starting blank. It is honest input: a self declared diet, not a scrape of private history.

Each tile is a gene with the real subreddits it stands for. Pick a few, name the creature, and hatch. The creature is born as a Gen-1 egg already leaning toward the chosen genes.

Nursery: a living 3D pet

The creature breathes, blinks, bobs, and droops when neglected. Drag to spin it. Every feed pushes points into a gene and visibly reshapes the body over time.

The panel shows the growth stage, the generation badge, the needs (fed level, growth to next stage, daily streak), and the dominant genes. The "visit an opposite sub" feed action deliberately develops the lagging side of a pair, nudging you toward better genetics.

Genome card: your build, shareable

The "what's your build" card. A single genetics score out of 100 and the six opposite pairs drawn as tug of war bars. This is the screenshot people post to argue about whether someone is really Mayhem dominant.

The score rewards broad development, not lopsided grinding, so a high number is proof you have crossed gene pools. It is identity flavored on purpose, because identity is what Reddit loves to debate.

Mate market: find your opposite

Every other creature in the subreddit, ranked by how complementary it is to yours, and each rendered live in 3D from its own genome. The strong matches are at the top.

Proposing is a deal: you state who keeps the single offspring and what you trade for it. A strong match makes a healthy, well developed child. Mating two similar creatures makes a busted, comedic, inbred one that is genuinely fun to show off.

Client, server, shared rules

One Devvit Web app, published as a single Interactive Post. The shared game logic is imported by the client, the server, and the tests, so the rules can never drift.

Component	Role	File
Genome model	genes, scoring, breeding, lineage	src/shared/genome.ts, creature.ts
Procedural 3D	grows geometry from the genome	src/client/render.ts
Living scene	Three.js scene + animation	src/client/scene.ts
Devvit server	Redis endpoints, deals, posts	src/server/index.ts
App config	post, server, menu, permissions	devvit.json

From a cold clone to a live post

Play it standalone (no Reddit account)

An in-memory world makes the whole game playable locally. Fastest way to see it.

```
git clone https://github.com/tdries/tamareddtchy.git
cd tamareddtchy
npm install
npm run dev      # open the printed URL, add ?demo=1
```

Run the tests

```
npm test      # game-balance + render structure, in plain Node
```

Publish to Reddit

- 1 **devvit login** to authenticate your Reddit account.
- 2 **devvit upload** to upload the app (pulls @devvit/web, builds client and server).
- 3 **devvit playtest r/yourTestSub** to run it live.
- 4 In the subreddit, use the mod menu item "**Create a Tamareddtchy nursery**". That post is the playable game.

Leave your bubble.

Raise something only the whole of Reddit could make.
